

## ATLAS News Page Type\*

We recently rolled out a new ATLAS-News page type that allows for better functionality in terms of overall look, content contribution, and user experience. Below are the instructions on how to add a new article.

\*this must first be set up on your site by the ATLAS Development team. If you do not have the new ATLAS-News page type set up and would like it, please contact ATLAS Support:

<http://atlas.atlasportals.com/Contact-Us>

1: Navigate to your news folder on your site, click on it, then press the plus sign at the top of the content tree:

2: Select "ATLAS-News" from the page type options

**Side Bar Settings**—in the new template, there is a side bar option! The default is to have the 3 most recent news articles appear in the side bar along with the title “Read More News” However, you can switch this to display other articles of the same category.

**Categories:** This is a new feature! It allows you to categorize your different articles. For example—you can categorize all your agronomy articles with “agronomy”. Then a user can click on that category and only pull in the articles that are also categorized as “agronomy”. This is similar to how blogs function with tags—however with a news article they are referred to as categories.

To create a category, click on “add categories”

Then click on “new” at the top of the window that appears:

Make sure it is a site category and then fill out the display name with what you want that category to be:

To select categories for you article, click on add categories and then check all the boxes that you want that article tagged as. Your site categories are anything that doesn't have “global after them:

Lastly, the WYSIWYG allows you to put whatever you want in the sidebar—use it for banners, other widgets, additional information.

4: After you're done formatting your article, press save & you're good to go!

## CONSIDER FUNGICIDE RESPONSE WHEN SELECTING SEED

7/10/2018

Print

Share

When considering seed choices for next season, include WinField United's response-to-fungicide (RTF) scores in your decision-making process.

In 2017, WinField United tested 199 corn hybrids at 41 Answer Plot® locations and compared corn hybrids sprayed with a fungicide at V5 and VT against those receiving no fungicide treatment. The yield difference between the treated and untreated plants ranged from a 4-bushel-per-acre decrease to a 37-bushel-per-acre increase, with an average response of 11.2 additional bushels per acre for the fungicide-treated plants.

After measuring the yield difference between hybrids, WinField United assigns each hybrid a high, medium or low response score based on its yield difference between the treated and non-treated compared to all hybrids tested. Choosing the hybrids with optimal RTF scores for your unique fields is key. Here are some things to consider.

### Monitor fields all year long

I recommend making your seed decisions a process, rather than something you only think about during the first part of
